Cal-Adapt

Cal-Adapt

A Tool for Energy Sector Resilience and Research

Developed by UC Berkeley's Geospatial Innovation Facility

Nancy Thomas, Executive Director

Shruti Mukhytar, Lead Developer

Brian Galey, Senior Developer

Eric Lehmer, Web Developer

Maggi Kelly, Faculty Advisor

Development Supported by the California Energy Commission
with oversight and guidance from:

Susan Wilhelm, Energy Generation Research Office (EGRO)
Guido Franco, Team Lead for Environmental Research, EGRO

Our Technical Advisory Committees (past and present)
Stockholm Environmental Institute (prototype)
Amy Luers, then of google.org, key early collaborator

Cal-Adapt

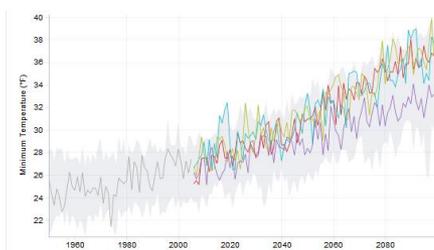

Agenda

- 9:30AM – 9:40AM **Welcome and Introductions**
- 9:40AM – 10:10AM **Cal-Adapt 2.0 Introduction and Demo**
- 10:10AM – 10:20AM **Cal-Adapt Energy Sector User Examples** (Susan Wilhelm)
- 10:20AM – 10:30AM **Audience Questions and Feedback**
- 10:30AM – 11:20AM **Focus Groups**
- Climate Tools (Temperature, Precipitation, and Relative Humidity)
 - Projected Wildfire Risks
 - Snowpack, Streamflow, and other Hydrological Projections
 - Cal-Adapt API
- 11:30AM – 11:45AM **Report back**
- 11:45AM – 12:00PM **Wrap up**

Cal-Adapt: A Tool for Energy Sector Resilience and Research

Cal-Adapt provides a scientific basis for exploring climate-related risks and resilience options for energy sector planning and adaptation.

- Convey local climate risks based on peer-reviewed science;
- Climate change projections presented in **easy-to-understand format** with plain English descriptions *and* scientific rigor;
- **Interactive maps and charts** provide a variety of approaches to explore different aspects of climate change;
- **Access to primary climate change data** for further analysis and research;
- Enable **development of custom tools** designed to manipulate climate change projections to support decision-making.

Cal-Adapt offers a variety of tools for exploring high-resolution projections of climate, including temperatures, precipitation, snowpack, sea level rise, and wildfire.

Cal-Adapt

Cal-Adapt 2.0 Enhancements

- Higher resolution, higher fidelity data
 - Temperature and precipitation at daily time steps from LOCA (Localized Climate Analogues) downscaled CMIP5 data, Scripps Institution of Oceanography (Pierce et al. 2014)
 - 1/16 degree grid, (~ 6km x 6km)
 - LOCA is better able to capture *extreme temperatures* and *spatial distribution* of precipitation
 - inundation (Delta as well as open coast and bay)
 - observed historical data (daily temperature, precipitation)
 - wildfires

Cal-Adapt 2.0 Enhancements

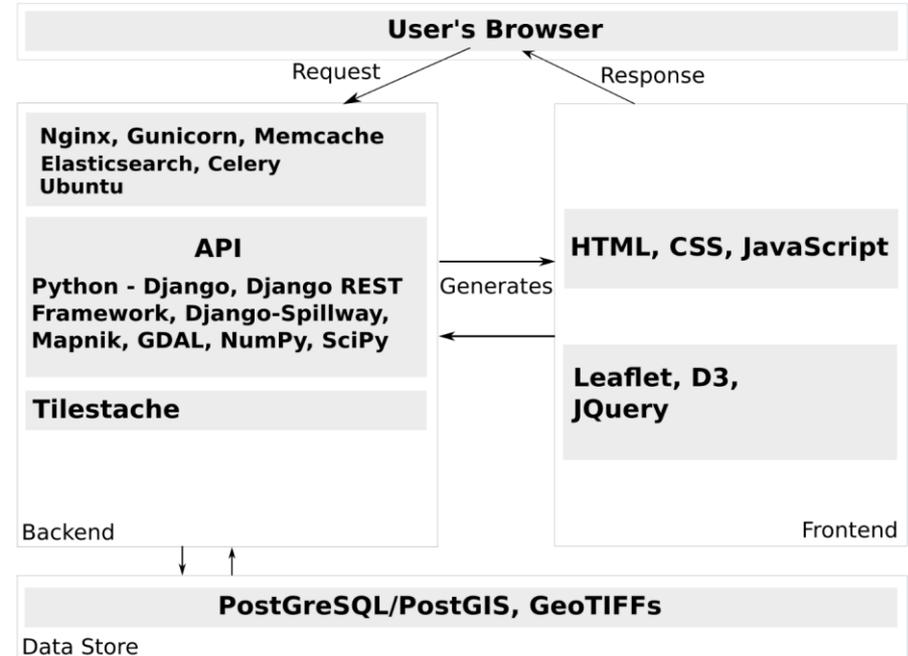

- Enhanced Data Visualizations
 - New boundary options: users can aggregate and view data by a number of different boundary options including counties, census tracts, watersheds, etc.
 - Users can also upload their own custom boundary file in a number of different formats (shapefile, GeoJson, kml, etc.)
 - Slider tools allow users to average values over user-specified time periods
 - Ability to print charts to image file to easily include in reports
 - Easy-to-understand text descriptions of visualization tools

Cal-Adapt 2.0 Enhancements

- Improved Access to Data
 - Save charts: users can download data visualizations directly to PNG files
 - CSV download: time series shown can be downloaded directly as csv files for use in many software programs
 - GeoTIFF: users can download data for selected variables for use in many geospatial applications
 - Primary NetCDF data: researchers can directly access NetCDF data for many data sets including:
 - all 32 CMIP5 models for 2 RCP scenarios (RCP4.5 and RCP8.5)
 - VIC modeled variables for all 10 CA models
 - Through Public API for custom tool development

Cal-Adapt API

- Open source architecture powered by Django, Django REST framework and Django-Spillway, an open source library developed at the GIF
- Dynamic temporal aggregation of time series data
- Spatial aggregation by counties, climate regions, watersheds, census tracts, legislative districts
- Allows other organizations to access climate data and build domain specific visualization and planning tools

How Does Cal-Adapt Support the Energy Sector?

Data Visualizations

- Support decision-making
- Communicate results of latest peer-reviewed scientific research
- Climate, hydrological, sea-level rise, snowpack, wildfire risk

Serve Data

- Common scenarios basis for 4th assessment research portfolio
- Scenarios aligned with recommendations for energy sector planning
- Enables cross-sector integration of results

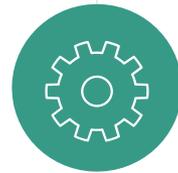

Provide Resources & Outreach

- Interface with resilience planning
- Webinars and training sessions

Develop Tools

- Build domain specific tools to support decision-making
- Focus on the energy sector

Providing Scenarios Approved by State for Energy Sector Planning

- Recommended scenarios available via Cal-Adapt, which defaults to the four “priority” models chosen to represent a range of possible futures.
- These scenarios are the **basis for California’s Fourth Climate Change Assessment**.
- IOUs requested set of common standards, timeframes, and scenarios to rely on for planning.
- OPR’s forthcoming guidance to state agencies will rely on these scenarios, too.

We Need Your Feedback!

Questions and Break-out Groups

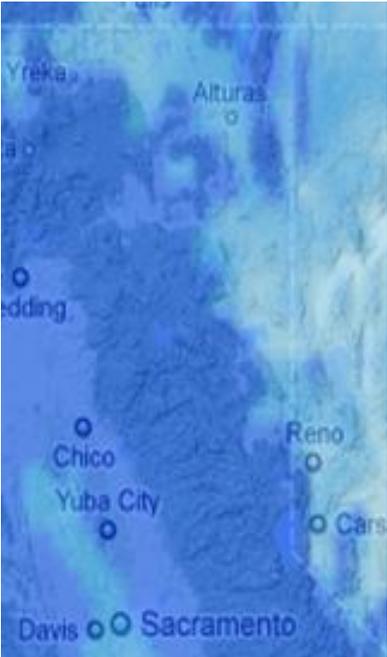

Cal-Adapt

User Feedback on Cal-Adapt 2.0

- Have you used Cal-Adapt?
- How have you used Cal-Adapt and what did you use it for?
- What do you like about Cal-Adapt?
- What would you suggest for improvement?
- We need **your** help in identifying new visualizations, tools, or features that would help support energy sector climate adaptation and resilience!

Cal-Adapt API
and Custom Tool
Development

Climate Tools

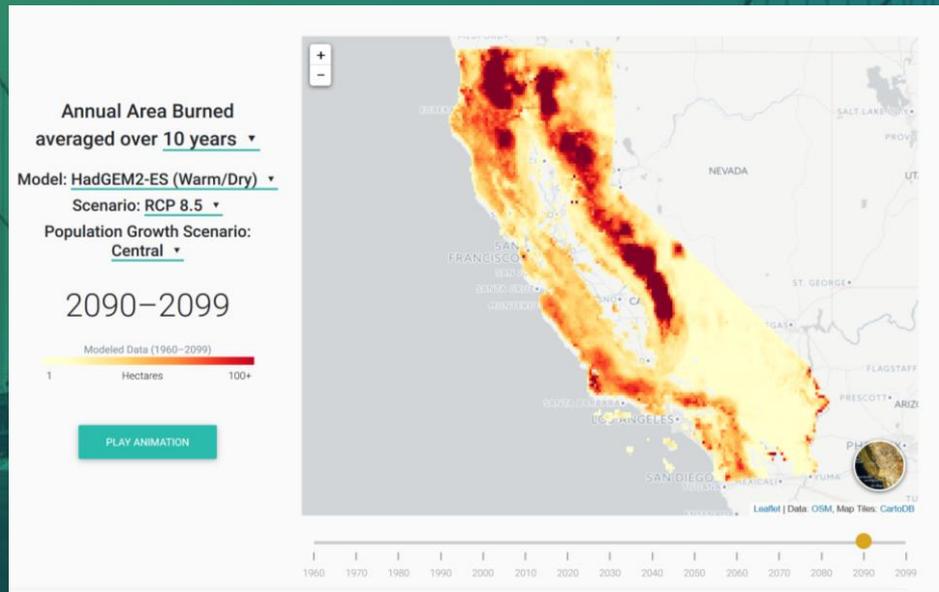

Temperature, Precipitation, and Relative Humidity

- What additional features would make the temperature and precipitation tools more useful?
 - Monthly and/or seasonal averages in addition to annual averages?
 - Additional stats: distribution as well as mean? Individual model results?
- What additional features would improve the usability of the extreme heat tool?
 - User-defined threshold?

Projected Wildfire Risks

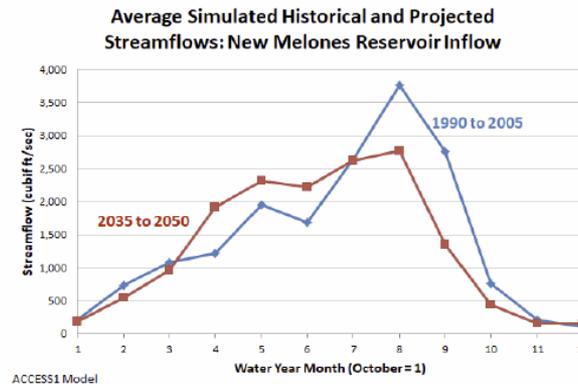

- What additional features would make the wildfire tool more useful?
 - Monthly and/or seasonal averages in addition to annual averages?
- Is it useful to look at multivariate charts? For example area burned vs. precipitation?
- New wildfire data layers will be included on Cal-Adapt when ready:
 - Fire severity
 - Emissions

Snowpack, Streamflow, and other Hydrological Projections

Streamflows: New Melones

- Hydrographs shift to higher flows in the winter and less in the summer
- Simulation of historical and projections using the Variable Infiltration Capacity (VIC) hydrological model. ACCESS1 global model downscaled with LOCA.
- Numerical values depend on the global model (e.g., ACCESS1) used.

Cal-Adapt API

Cal-Adapt API (Application Programming Interface) provides programmatic access to climate data hosted on Cal-Adapt. In general, an API is like a cog that allows two systems to interact with each other, e.g. a web browser on your computer and the Cal-Adapt server.

The Cal-Adapt API is built using [Django](#), [Django REST framework](#), and [Django-Spillway](#), an open source library developed at the GIF. The API follows an architectural style called REST (REpresentational State Transfer) which uses HTTP as the transport protocol for the message requests and responses.

What is a REST API?

A general model of a REST API (source)

The client (web browser, desktop GIS software, Python script, etc.) sends a request to the API server for data and the server sends a response back. The client and server can be based in any language, but HTTP is the protocol used to transport the message. This request-and-response

Backup Slides

Four Slides re: Major Datasets

- LOCA: temperature, precipitation, relative humidity
- Hydrological data
 - VIC for a number of hydrological variables
 - Bias-corrected, routed stream flow at 11 locations in California
- Wildfire projections

- Gridded observed data: temperature, precipitation
- Sea Level Rise: inundation associated with various increments of SLR (0 to 1.4 m), as portrayed by high-resolution hydrological modeling
 - Cal-Adapt 2.0 also links users to Our Coast, Our Future, a publicly available interactive tool that presents results from USGS's Coastal Storm Modeling System (CoSMoS)
- Long Drought Scenarios

LOcalized Climate Analogues (LOCA): Temperature, Precipitation, Humidity Projections

LOCA provides high-resolution ($1/16^\circ$ grid, ca. 3.6 miles by 3.6 miles) projections at daily time steps for:

- Maximum temperature
- Minimum temperature
- Precipitation
- Relative humidity

LOCA was developed by David Pierce, Dan Cayan, and others at the University of California, Scripps Institution of Oceanography. Learn more about LOCA at:

- DW Pierce, DR Cayan, and BL Thrasher (2014). "Statistical Downscaling Using Localized Constructed Analogues (LOCA)." *Journal of Hydrometeorology*. <http://journals.ametsoc.org/doi/abs/10.1175/JHM-D-14-0082.1>
- <http://loca.ucsd.edu/>

Hydrological Data: Variable Infiltration Capacity Model (VIC)

VIC is a hydrological model that is driven by daily maximum and minimum temperatures (projected and observed) to provide high-resolution (1/16° grid, ca. 3.6 miles by 3.6 miles) projections at daily time steps for a suite of hydrological parameters:

- Evapotranspiration (mm/day)
- Runoff (mm/day)
- Soil moisture (3 layers) (mm)
- SWE (snow water equivalent) mm
- Daily change in SWE (mm/day)
- Snowfall rate (mm/day)
- Rainfall rate (mm/day)
- Snow melt rate (mm/day)
- Dew rate (mm/day)
- Sensible heat (W/m²)
- Latent heat flux (W/m²)
- Potential evapotranspiration (PET) from vegetation (mm/day)
- Air temperature (2 m daily average) (°C)
- Relative humidity (2 m above surface) (percent)
- Specific humidity (2 m above surface) (kg/kg)
- Albedo (surface reflectivity) (fraction)
- Shortwave down (W/m²)
- Shortwave net (W/m²)
- Longwave net (W/m²)
- Sublimation net (mm/day)

VIC was developed by X. Liang (University of Washington) and others. Learn more about VIC at:

- <http://www.hydro.washington.edu/Lettenmaier/Models/VIC/index-old.shtml>

Hydrological Data: Stream Flows at 11 Locations

Stream flows at 11 locations were constructed by routing the projected run-off output from VIC (1950-2100, RCP4.5 and RCP8.5) and bias-correcting based on the Department of Water Resources' estimates of unimpaired flows through 2014. The 11 locations for which daily streamflow data are available are:

- Sacramento River near Red Bluff (*VIC name*: SAC_BEND_BRIDGE)
- Feather River near Oroville (*VIC name*: OROVILLE)
- Yuba River at Smartville (*VIC name*: SMARTVILLE)
- Bear River near Wheatland (*VIC name*: BEARCREEK)
- American River at Fair Oaks (*VIC name*: FOLSOM_INFLOW)
- Mokelumne River at Pardee Reservoir (*VIC name*: PRD-CAMANCHE)
- Calaveras at Jenny Lind (*VIC name*: NEW_HOGAN)
- Stanislaus River at New Melones Reservoir (*VIC name*: N_MELONES)
- Tuolumne River at Don Pedro Reservoir (*VIC name*: DPR_INFLOW)
- Merced River at Exchequer Reservoir (*VIC name*: LK_MCCLURE)
- San Joaquin River at Millerton Reservoir (*VIC name*: MILLERTON)

Bias-corrected stream flows were developed by David Pierce, Jordan Goodrich, and Dan Cayan at UCSD's Scripps Institution of Oceanography.

Wildfire Projections: Annual Average Area Burned

Parameters describing projected wildfires were developed for monthly time steps on a 1/16° grid for 1950-2100, RCP4.5 and RCP8.5, and four global climate models (CanESM2, CNRM-CM, HadGEM2-ES, and MIROC5). Population trajectories and land use/land cover were also considered.

For each scenario, 100 Monte Carlo simulations were developed.

- At this point, Cal-Adapt shows annualized average area burned.
- Other parameters (*high severity burned area, given a fire; emissions*) are forthcoming and may be visualized on Cal-Adapt.

Wildfire scenario projections were provided by Dr. LeRoy Westerling at the University of California Merced, using a statistical model based on historical data of climate, vegetation, population density, and fire history coupled with regionally downscaled LOCA climate projections.

Gridded Observed Data

Historical observed daily temperature and precipitation data from approximately 20,000 NOAA Cooperative Observer (COOP) stations form the basis of a gridded dataset from 1950–2013 (daily time steps, $1/16^\circ$ grid or ca. 3.6 miles by 3.6 miles).

- Maximum temperature
- Minimum temperature
- Precipitation

These data were developed by B. Livneh and colleagues. Details are described in:

- B Livneh, TJ Bohn, DW Pierce, F Munoz-Arriola, B Nijssen, R Vose, DR Cayan, and L Brekke (2015). "A spatially comprehensive, hydrometeorological data set for Mexico, the U.S., and Southern Canada 1950–2013." *Scientific Data* 2, Article no. 150042. <https://www.nature.com/articles/sdata201542>

Sea Level Rise and Inundation Associated with Extreme Storm Events

Inundation depths associated with various increments of sea level rise (SLR) ranging 0 to 1.41m and extreme storm events based on a high-resolution hydrodynamic model coupled with high-resolution earth surface models. Storm events approximate observed historical 100-year storms. Data represent the San Francisco Bay, the Sacramento-San Joaquin Delta, and the entire California coast. Shown on Cal-Adapt is:

- Maximum inundation depth

These data were developed by J. Radke and colleagues at the University of California, Berkeley. Details are described in:

- JD Radke, GS Biging, M Schmidt-Poolman, H Foster, E Roe, Y Ju, O. Hoes, T Beach, A Alruheil, L Meier, W Hsu, R Neuhausler, W Fourt (2017). *Assessment of Bay Area Natural Gas Pipeline Vulnerability to Climate Change*. California Energy Commission. Publication number: CEC-500-2017-008.
<http://www.energy.ca.gov/publications/displayOneReport.php?pubNum=CEC-500-2017-008>

Long Drought Scenarios

Two scenarios portray long droughts to enable exploration of extended (20-year) drought conditions. Cal-Adapt provides data describing a 2051-2070 drought associated with the HadGEM2-ES LOCA downscaled projection for RCP8.5, as well as a nearer-term drought (2023-2042) created by adjusting the temperatures for the later century drought to cohere with an earlier time frame. Data comprise projections at daily time steps and 1/16° grid for:

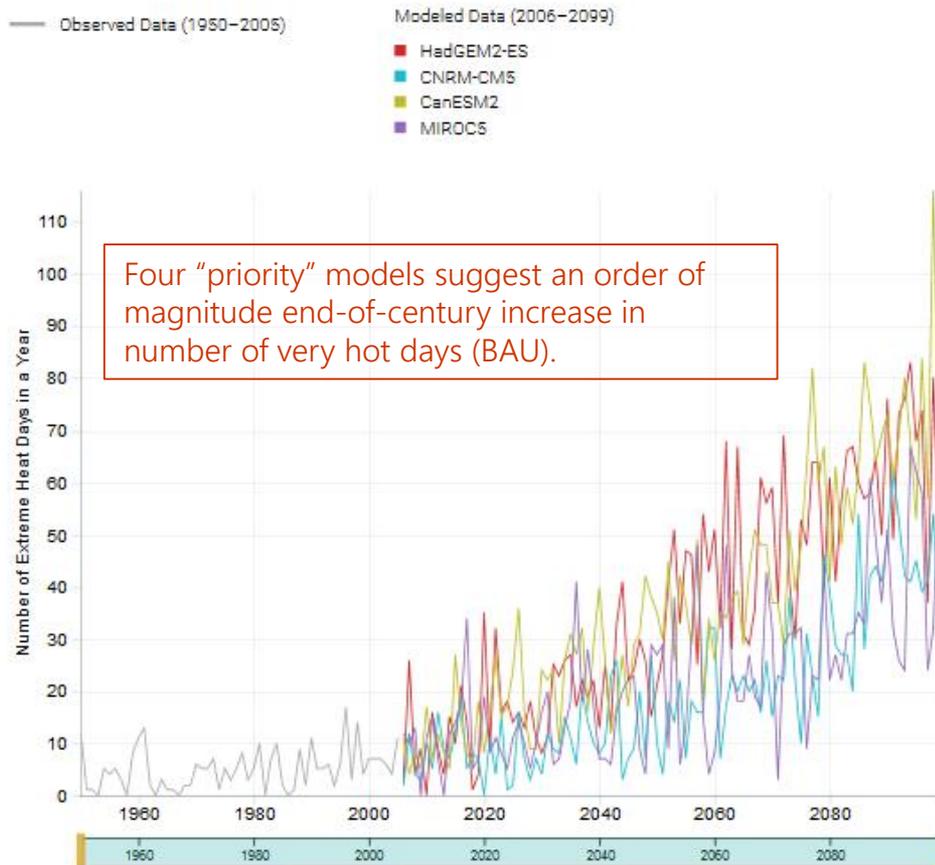

- Maximum temperature
- Minimum temperature
- Precipitation
- Select VIC parameters: evapotranspiration, base flow, runoff, soil moisture (3 layers)
- *... and all of these various for the 5 years prior to, and 4 years after, the long drought.*

These data were developed by D. Cayan, L. Dehaan, and colleagues at UCSD's Scripps Institution of Oceanography.

A new tool enables calculation of heating degree days and cooling degree days— both used as proxies of demand for heating and cooling buildings— based on user-specified parameters.

This is important because we can no longer use historical climate as a legitimate proxy for future demand!

Additional Data Available at: <http://beta.cal-adapt.org/data/>

Download Data

Discover and download climate data from California's scientific and research community in NetCDF or GeoTIFF formats. Many datasets are also available through the public Cal-Adapt API.

LOCA Downscaled Projections

LOCA downscaled climate projections for maximum temperature, minimum temperature and precipitation from Scripps Institution of Oceanography (Pierce et al., 2014).

GeoTIFF NetCDF API

Gridded Observed Data

A gridded dataset of observed maximum temperature, minimum temperature and precipitation (Livneh et al., 2015).

GeoTIFF NetCDF API

Sea Level Rise - CalFloD-3D

Inundation depths for San Francisco Bay Area, Sacramento - San Joaquin Delta and the California coast during near 100 year storm events coupled with projected Sea Level Rise scenarios (Radke et al., 2016).

GeoTIFF API

Snowpack (Forced by LOCA)

Snowpack projections generated through use of Variable Infiltration Capacity (VIC) model forced by LOCA downscaled climate projections from Scripps Institution of Oceanography (Pierce et al., 2014).

GeoTIFF NetCDF API

Snowpack (Forced by Gridded Observed Data)

Snowpack data generated through use of Variable Infiltration Capacity (VIC) model forced by gridded observed data (Livneh et al., 2015).

GeoTIFF NetCDF API

Wildfire

Annual averages of area burned for combination of 4 GCMs, 2 RCPs and 3 population growth scenarios. (LeRoy Westerling, UC Merced).

GeoTIFF NetCDF API

Long Drought Scenarios (LOCA)

Temperature, precipitation plus a set of VIC variables from two 30 year drought periods. (Pierce et al., 2014).

NetCDF

Additional VIC Variables (forced by LOCA)

Additional climate variables generated through use of Variable Infiltration Capacity (VIC) model forced by LOCA downscaled climate projections from Scripps Institution of Oceanography (Pierce et al., 2014).

NetCDF

Additional VIC Variables (forced by Gridded Observed Data)

Additional climate variables generated through use of Variable Infiltration Capacity (VIC) model forced by gridded observed data (Livneh et al., 2015).

NetCDF

Relative Humidity

LOCA downscaled climate projections for relative humidity from Scripps Institution of Oceanography (Pierce et al., 2014).

NetCDF

Streamflow

VIC routed and bias corrected streamflows driven by LOCA downscaled temperature and precipitation.
